

A lighter approach

Having won four **Crystal Cabin Awards** in 2007 for developing a hollow stainless steel sheet called **Hybrix™**, Lamera will display samples of the new ultra light material **Alubrix™** (aluminium Hybrix™) at Aircraft Interiors Expo 2010.

Mattias Grufberg, one of the founders of Lamera, commented; “People kept asking us why we didn’t apply our technology to aluminium to make it even lighter. Now, we realized the idea. Alubrix™ is very promising and, as we hoped, even lighter than the successful original stainless Hybrix™”.

Lamera was also nominated for the Crystal Cabin Awards in 2008 in co-operation with Sandvik for introducing DecoBrix™: colour integration in steel, essentially a nano-technology to produce pre-coloured metal on coil, so that painting or decorative laminates are not needed.
